Polycarbonate Lenses for Children

***New VSP benefit makes
protecting your child's vision
even easier***

Your vision benefit from VSP now includes polycarbonate lens coverage in full for children. Widely regarded as the safest lens for children, polycarbonates offer 10 times the impact resistance of most plastic lenses, with the added advantages of being thinner, lighter and featuring UV and scratch-resistant qualities.

Great for Sports

Polycarbonate lenses in your child's glasses protect their vision by holding up to rough play or sports practice. With high impact resistance, polycarbonate lenses provide greater protection against eye damage and vision loss from broken or shattered lenses.

Lighter Weight

Polycarbonate material is lighter than standard plastic or glass, which is good news for youngsters with strong prescriptions. As well as being lighter, polycarbonate lenses are thinner than standard plastic or glass, which contributes to the lighter weight.

Resists Scratches

Although no lens is scratch proof, polycarbonate lenses come with a scratch-resistant coating to keep them clear as long as possible, even when worn by children.

Polycarbonate lenses also offer inherent ultraviolet protection. About 99 percent of potentially damaging UV rays are filtered out by these lenses, whether the rays come from sunlight, fluorescent lights or a computer screen.

These lenses are not only for children. If you're due for a new pair of glasses, consider polycarbonate lenses. You'll be just as happy as your children.
